Boxplot of the distribution of the variables λ , v , α_1 , and α_2 . The x-axis is labeled "Variable". The y-axis represents the values of these variables. The plot shows that λ and v have very narrow distributions with medians around 0.5. α_1 has a wider distribution with a median around 0.5. α_2 has the widest distribution with a median around 0.4. Red dots indicate the mean, and black dots indicate outliers.

A boxplot showing the distribution of four estimated parameters: λ , ν , α_1 , and α_2 . The y-axis is labeled 'Value' and ranges from -4 to 0. The x-axis is labeled 'Variable'. The distributions are as follows:

- λ : A very narrow distribution centered around 1.0, with a red dot at the median and a black horizontal line representing the box.
- ν : A very narrow distribution centered around 1.0, with a red dot at the median and a black horizontal line representing the box.
- α_1 : A distribution centered around -1.0, with a red dot at the median and a black box. There are several outliers below the lower whisker, around -2.5.
- α_2 : A distribution centered around -2.0, with a red dot at the median and a black box. There are several outliers below the lower whisker, around -4.5.
